Front-End Development Coding Challenge

All candidates for development positions in our office are asked to complete a coding challenge as part of the interview process. Please complete the following challenge and return your results as soon as possible. Here is the challenge:

Write a react component that starts a timer when you first click on it. Each subsequent click after that will display the split in an unordered list below without stopping the timer. Clicking on any split will remove all splits below that, reset the timer to the clicked on split, and highlight the split. Feel free to compose the component of child components if that is helpful.

Please style the component using your CSS pre-compilation language of choice (sass, less, etc.). The project should build and run a local server via npm.
